

EnerGenius® IQ

Automatic DC Power Supply/Charger With Intelligent Battery Monitoring and Data Logging

CONSULTING - SPECIFYING
engineer.
2009
PRODUCT OF THE YEAR Gold

Built-in intelligence makes it easy to correctly configure charger for battery and site conditions
Battery check system automatically tests battery to reduce risk of unexpected application shutdown
Black box data recorder helps spot previously hidden problems and direct preventive maintenance
Advanced user interface, USB PC utility provide easy to understand system status and control
Dual microprocessors, digital load sharing minimize risk of single point failure
Modbus communication option provides remote monitoring, administration

Consulting – Specifying Engineer 2009 Product of the Year

Rugged utility-grade charger

C-UL listed, CE Marked

Filtered output

Temperature compensation

Optional Modbus data communications

IBC seismic certified, optional OSHPD pre-approval

Backlit, full-text LCD

Simple charge mode control

Battery check system

LED system mimic panel

Dual microprocessors

Onboard data logger

Battery Expert System

All-digital design – no potentiometers

Constant Voltage, Current Limited, Filtered Battery Charger

Refineries and chemical plants
DC control systems
Engine starting

Oil and gas pipelines
Offshore platforms

Electric utility substations
Switchgear

EnerGenius IQ is a rugged utility-grade battery charger/rectifier with microprocessor control.

In addition to providing DC power and charging your battery, EnerGenius IQ automatically tests your battery performance, logs all relevant site data and clearly communicates results.

Key Features

Constant voltage, current limited and filtered DC output

Simultaneously supplies smooth DC to critical loads, recharges the connected system battery and automatically maintains flooded lead-acid, VRLA, or nickel-cadmium batteries in peak condition.

Integrated battery check system cuts risk of undetected battery failure

Batteries have limited lifetimes, and can fail without warning. The on-board battery system determines if your battery can support a connected continuous load without taking the battery offline or shutting down charger input power.

● PASS
● FAIL

Black box recorder discovers hidden battery and site data to direct preventive action

Data recorder captures and logs previously unavailable system and site data. Data helps to perform failure analyses and to demonstrate if site conditions are conducive to long battery life. Users can leverage this knowledge to improve reliability of battery sites throughout their networks.

Dual microprocessors minimize risk of single point failure

Dual microprocessors provide internal fault tolerance, and provide a level of system reliability superior to either conventional analog or single microprocessor-controlled chargers.

Optional multi-function communications module extends the IQ's capabilities to the network

CommsGenius provides Modbus networking (RS-485 and Ethernet), precise digital load sharing for two chargers, and PC-based charger setup & administration.

Maximizes DC system reliability at lowest total cost

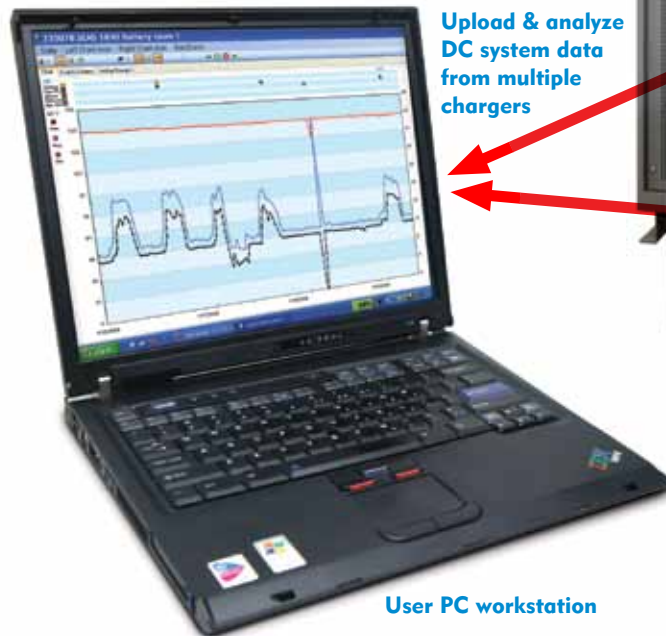

On-board Information Technology Takes System Reliability to a New Level

- Battery check system
- Industry-first “black box” data logger

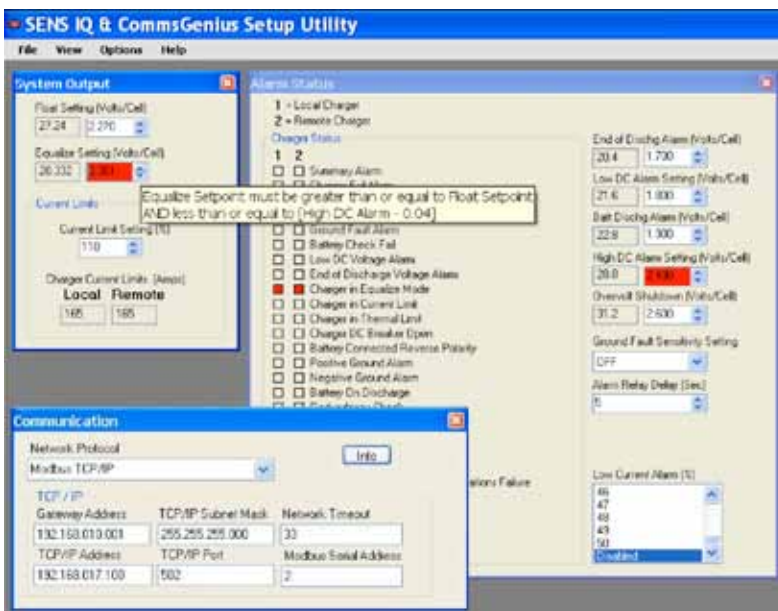

Standby batteries have limited lifetimes and typically fail without warning – causing costly application shutdown. SENS EnerGenius IQ integrates battery checking and system data logging functions into the charger, making DC system health assessment less costly and easier to use than ever before.

- *Insight* GUI application makes history data easy to understand

SENS *Insight* is a PC-based application that converts charger history data into easy-to-understand charts and tables. *Insight* helps you to see and compare a variety of different analog and digital information. Understanding this information helps avert system downtime, and is essential in performing root cause diagnosis of system problems.

- *Setup Utility* GUI application makes setup a snap

SENS *Setup Utility* is a PC-based application that communicates with the charger over USB. It is included with the Modbus communications option and the forced load share & remote temperature compensation package.

Setup Utility's GUI makes communications parameter setup easier than ever before, and enables deployment of pre-programmed standard voltage and alarm settings to multiple chargers, as might be required across a fleet of chargers.

EnerGenius IQ Features and Equipment Packages

	Feature	Filtered ¹ 511	Eliminator ² 512	Eliminator Plus ³ 514	Extreme ⁴ 534

"Std" = standard feature. "-" = not available. "Factory option": factory installed option only. "Optional": Feature can be installed in the system at any time. (1) Lowest cost package. (2) Specify for lower output ripple. (3) Adds reverse polarity protection and blocking diodes to Eliminator package. (4) Specify for sites with heavier electrical transients and/or where AC supply is of low impedance. (5) "On battery" ripple measured at the terminals of a battery rated in AH > 4 times charger's amp rating. "Off battery" ripple measured at the load end of charger output cables. (6) On units rated < 3.4 KW output. Higher power units require either single input voltage or field selectable 208/240 input. See last page for details. (7) Only available in larger Q2 housing. (8) Requires Extended Individual Form C Relays package (Option B in Section F on Page 7). Relay rating is 60W @ 117 VAC. (9) Requires Remote Alarms & Communications Feature Package L, K, M or N (see Section F on Page 7). (10) Requires Extended Individual Form C Alarms option + external contactor ordered separately. (11) Wall-mount units only.

Specify the EnerGenius IQ System Best For Your Needs

Follow these simple steps to specify the correct charger model number:

A Choose the right output voltage to suit your battery

Nominal charger volts	Lead-acid battery	Nickel-Cadmium battery
12	4-6 cells	6-10 cells
24	8-12	12-20
48	16-24	25-38 (25-40)
110-120	40-60	64-93 (64-96)
220-240	80-120	128-185 (128-192)

Cells in (parentheses) indicate lower maximum per-cell charging voltages

B Choose the correct output current rating

Use formula to solve for charger amp rating to simultaneously power your load and recharge your battery

FORMULA

$$\left[\frac{AH \times K}{T} \right] + L = I$$

AH, or ampere hours capacity to be returned to the battery. Specify either duty cycle (amps x discharge hours) or AH rating of battery.

Constant K recharge inefficiency constant

- Lead battery 1.15
- Nickel battery..... 1.40

T is the time in hours you wish to allow for recharge.

Example: Recharge a 220 AH lead-acid battery in 12 hours while powering a 10 amp load.

$$\frac{220 \times 1.15}{12} + 10 = 31.08 \text{ amps.}$$

Use 35A charger, which is next available rating.

C Specify your AC input supply

All chargers supplying output power less than 3.4 KW come standard with field selectable input

D Safety agency marks

Factory specified – no decision needed

E Specify the IQ features package suited to your needs

F Specify alarm relay/communications configuration

G Specify mounting configuration

H Specify optional accessories as needed to complete your system

I Specify battery type and number of cells

How To Order

IQ	Nominal DC output voltage			Rated output current			AC	Agency	Feature package			Alarm	Mounting	SENS use
Q	0	4	8	0	3	5	T	L	5	1	4	A

(1) Activates on any alarm listed under Footnote #3. (2) AC fail, charger fail, low DC volts, high DC volts, ground fault, battery check fail. (3) AC fail, charger fail, low DC volts, high DC volts, end of discharge, ground fault, battery check fail. (4) Enables remote reading of all alarms & analog values. Ethernet and RS-485 interfaces. RTU and ASCII modes.

NOTE: When dual charger configurations are set up for forced load share only 1 ea. charger may be equipped with the CommsGenius card. One CommsGenius supports load share, RTS and Modbus function in both chargers.

H Optional features not shown above

- Freestanding, floor-mounting housing (size Q2 only): Order p/n 209399
- Drip shield: Order p/n 209320 for Q1 or 209321 for Q2
- Front door lock: Order p/n 808990
- AC surge protective device to UL 1449 3rd ed.: 480 & 400 VAC order p/n 808357; ≤ 240 VAC order p/n 808358

I Specify battery type and number of cells

- Flooded lead-acid VRLA Ni-Cd (specify number of cells in Ni-Cd battery)

Table of Ratings, Inputs, Circuit Breakers, Weights and Dimensions

^a Indicates standard input voltage configuration. Standard input voltage configuration for 50/60 Hz units is either field selectable 120/208/220-240 VAC or 230 volts. All units with field selectable 60 Hz input also have field selectable 50/60 Hz voltage. Circuit breaker ratings are identical for field selectable units. 400 VAC, 50/60 Hz is available on special order. ^b Current ratings shown are for respective input voltages. Current consumption at nominal input voltage is 8-13% less than worst case value shown, depending on model. ^c Numbers in black show AC input breaker ratings that correspond to input voltage options. Number in blue shows DC output breaker rating. ^d Field selectable 208/240 input option is not UL listed.

Housing Dimensions
